Potential competing interests: No potential competing interests to declare.

The topic is good but requires checking for similarity index.

Proper literature reviews need to be done.

Proper methodology of how AI and deep learning is used to make decisions in fasting for diabetic patients is missing.

Limitations in the current study are missing.

Better to include a proper data set about diabetic patient fasting, then apply the methodology and give the results with a conclusion.

Future work has to be included.

Comparative analysis has to be done.
