

Review of: "Comparing Visual and Software-Based Quantitative Assessment Scores of Lung Parenchymal Involvement Quantification in COVID-19 Patients"

Ezhil E. Nithila

Potential competing interests: No potential competing interests to declare.

Comments

1. The author concentrates more on software tools and not on scores. Explanations regarding the scores were lagging.
2. Discussion regarding Covid-19 patients with pneumonia presenting with fever, cough, dyspnea, myalgia, and fatigue is not explained. The explanation inside the article was not clear.
3. Number of datasets was very limited. More datasets can be taken. Moreover, the hospital where the dataset was taken was not mentioned.
4. Comparison with other work was missing.
5. Statistically significant findings according to the radiological scores can also be tabulated.

Overall suggestion: Major revision can be done before publication.
