Potential competing interests: No potential competing interests to declare.

The suggestions to always scrutinize how AI works sound vague. May elaborate how the public/users are able to do this in view of the fact that they probably have no access at all to the training datasets, design of the AI system etc. The statements that in ensuring AI is used in compliance with ethical principles and human rights, principles such as transparency, accountability, fairness and privacy must be respected; and also that all AI systems must be explainable etc seem more relevant for AI developers and the author did not explain how these are applicable or should be observed by the users in using AI.
