Potential competing interests: No potential competing interests to declare.

The article provides detailed scientific information on the importance of nitrogen and crop geometry in optimizing growth and yield, which enhances the technical rigor. The literature cited is recent and relevant to the theme. However, certain sections, such as the environmental and edaphic requirements, are somewhat repetitive. For instance, the ideal temperature range for baby corn is mentioned twice in close proximity, which disrupts the flow and can make it harder for the reader to stay engaged. Streamlining these points would enhance readability. With that in mind, I would say this article can be published in this journal.
