This article presents an interesting theoretical discussion.

The discontinuity analyzed in several scientific areas is interesting but does not add much to the work on the urban issue.

The approach refers to urban evolution during the last centuries, especially in cities in Arab countries. This circumstance is not very different from what happened in European cities, as mentioned in the text.

The analysis does not value the major changes in the means of transport in the city, which had a huge impact on urban design and consequently on the morphology of the cities.
