Review of: "Tomorrow's Buildings: What Are the Occupational Health and Safety Issues?"

Ahmad Soltanzadeh¹

1. department of occupational health and safety engineering, Qom University of Medical Science and Health Services, Qom, Iran

It was an interesting study.

It seems that a suitable approach has been taken to design and conduct this study.

A few points should be noted by the authors:

1. The main and important findings are not stated in the abstract.
2. There is confusion in the conclusion. It is suggested that the authors present the practical results.
3. Some studies, such as the following reference, should be used in the discussion.

Soltanzadeh A, Mahdinia M, Omid Oskouei A, Jafarinia E, Zarei E, Sadeghi-Yarandi M. Analyzing health, safety, and environmental risks of construction projects using the fuzzy analytic hierarchy process: A field study based on a project management body of knowledge. Sustainability. 2022 Dec 9;14(24):16555.

4. The limitations of the study should be written.
5. The studies that could be suggested in this regard in the future should also be mentioned.
