Potential competing interests: No potential competing interests to declare.

This article argues about the importance of discovering spatial clusters that enable us to pinpoint the source of an epidemic.

While the objective of this idea is important and interesting, the article lacks elaboration on how the objective is actually achieved.

The author refers to the Topological Weighted Centroid (WTC) as a potential candidate for a clustering method that can achieve the objective, but does not provide any detailed information. Elaboration of TWC in the body of this manuscript will significantly improve the readability of this article.
