

Review of: "Toxicity of Olea africana in Artemia Salina and Mice"

Masuma Akter

Potential competing interests: No potential competing interests to declare.

A precious work has done by the author. This is a well conducted work and manuscript also organized in a better way, but something that needed to clarify

1. Kindly explain the way by which you select the dose and amount of mice use for the experiment?
2. There is any special reason that you only used the female mice and do you think that's maintain the uniformity of results?
3. In section No. 2.6 you described about the acute toxicity assay in mice but the result section represents no data related to acute toxicity assay. You told that All the animals were observed for 24 hours but what is the observation? If you discuss about the mortality rate, then I will think the concept will be more clear.
4. Why You don't use any positive control groups during the experiment of acute toxicity and Subacute toxicity Assay in mice?
