This survey covers a great deal of the whole problem regarding the methods of medical image registration. First of all, the work presented in this paper is descriptive and meticulous. The number of articles referenced by the author support the article. The images as well as the tables enhance even more the description of the article. In short, the author does manage to present the work without confusing the reader and explain all the necessary details in a way that even a reader ignorant of the subject of image registration or deep learning can understand it. Therefore, I strongly support the publication of this article.
