

Review of: "Deep Learning in Medical Image Registration: Introduction and Survey"

Chengdong Wu

Potential competing interests: No potential competing interests to declare.

This study provides a comprehensive overview of the current research landscape in the field of medical image registration, and its overall quality is exceptional. While the introduction to image registration is vivid and expressive, it appears to be somewhat lengthy, and I would suggest condensing it appropriately for conciseness. Additionally, it would be beneficial to include an overarching comparative figure, allowing readers to gain a more intuitive understanding of the distinctions and relationships among various existing MIR framework structures. Furthermore, I recommend incorporating comparisons of different methods, particularly in the context of performance validation, to enhance the depth of the study.
