Peeling skin syndrome type B

INSERM

Source

INSERM. (1999). Orphanet: an online rare disease and orphan drug data base. Peeling skin syndrome type B. ORPHA:263553

Peeling skin syndrome (PSS) type B, also known as peeling skin disease (PSD), is a rare inflammatory form of ichthyosis (see this term) characterized by superficial patchy peeling of the entire skin with underlying erythroderma, pruritus, and atopy.
