

# Review of: "Heritability and Genetic Correlations of Growth Traits Among Inbred Population of Nigerian Chickens"

Paul Adetunji<sup>1</sup>

<sup>1</sup> Obafemi Awolowo University Ile-Ife

**Potential competing interests:** No potential competing interests to declare.

The authors must be commended for a job well done on this research topic. However, there are few areas from my end the authors need to look into:

## Abstract

At least the full meaning of 1BW, 8BW, 4BL, 8BL, 4SL, 4CG, 8SL and 8CG must have been written once before abbreviation.

## Introduction

=> The reference cited (Adedokun SA and Sonaiya EB, 2001) for 120million poultry birds in Nigeria is extremely old to represent the current population of poultry birds in Nigeria. I would suggest you consult more recent papers of 2022 or 2023.

## Results and Discussion

=> Why were the results of weeks 2 and 6 not included in table 1?

=> I cannot see anywhere you have explained and/or discussed your table 1

=> Your discussion revolved around four sets of researchers (Ohagenyi et al., 2012, Ndofor-Folong et al., 2014, Eze, 2019 and Ashok and Khan, 2002). Since several researchers have worked on this related area over the years, I would suggest a more robust discussion than this.

## Conclusion

=> You may need to recheck the paragraph three of your conclusion.

Best regards.
