Dear authors, I want to congratulate you on the interesting article. It seems to be an interesting application. I want to suggest two improvements:

1. Regarding the overall size of the drone, I suggest you round the value to the mm unit because the prototype is not yet completed, so maybe this dimension will change, and also because it is enough for the applications that the drone will have.
2. Regarding the simulation and the conclusions that you obtained, I think they are interesting conclusions because other drone makers could take advantage of these considerations while building new drones. So I suggest you explain better how you tuned the parameters, which kind of tests you performed, which kind of conditions you evaluated (partial load, full load, disturbance wind), what results you achieved, the problems you faced, and the solutions you think will solve those problems.

Congratulations again and well done!
