Potential competing interests: No potential competing interests to declare.

The article is very well written however, the abstract does not specify how the study was carried out, it also lacks recommendations which should have followed the discussions. In the abstract the study aims to propose a framework for an integrated mesh of digital security ecosystems as strategic aid in architectural and urban design decisions by city municipals, while in the body of the article the aim is to qualitatively explore the emerging concepts under 3rd Generation CPTED with the adoption of technology in designing public realms can these aims be harmonized into one aim? On the whole the write up has placed a lot of emphasis on the internet of things but not much on inclusive design approaches that emphasis aesthetics and are user friendly.
