

Review of: "ABC Group's Business Continuity Based on Uncertainty Analysis"

Prof. Ihab Sawalha¹

¹ American University of Madaba

Potential competing interests: No potential competing interests to declare.

The paper has more or less improved, perhaps not to the expected level, but at least it reads well and discusses an important topic. It still lacks in-depth insight, yet the way it relates BCM to the other aspects of the organization is interesting. Perhaps, as one of the reviewers mentioned, relating to the overall structure of a typical research paper, this paper does not adhere sufficiently to the universally accepted research structure and the in-depth review and the critical analysis of the literature. However, if this structure is accepted by Qeios, then I will accept the paper on the basis that it is presented clearly, it is understandable and covers an important topic with an adequate amount of literature coverage (i.e. the number of references included) (better shape when compared to v1 certainly). Plus, it seems obvious that the author(s) is passionate about the topic, since BCM has been linked to the topics of uncertainty, supply chain and business performance in a smart and interesting way. Perhaps, if you allow me to add one more final remark before finally accepting the paper, and which I believe will improve the quality of the content of the paper, that is supporting the literature section by addressing the issue of BCM international standard; which is universally adopted as an international framework for practice and implementation; the ISO22301:2019. Good luck.
