## Review: Economics of Cattle Fattening- A Case of Bangladesh

### Summary

- Well-written article, detailed enough for the reader to understand the background, methodology, and results.

### Suggestions:

- **Problem:** I seem to have missed the problem, or didn't get it. May the author try and add something that would indicate the research problem that the author discovered and that made him/her conduct the study.
- **Materials and Methods:** The units of measurement of the Cobb-Douglas production functions aren't stipulated. E.g., Purchase price of cattle (BDT); X6 = Treatment cost (BDT); X7 = Feed cost (BDT); X8 = Labor cost (BDT) — all these variables should be clearly stated as being on a per-cattle basis as guided by the dependent variable (Y).
- X5 should be the average price since these are different sellers
- **Results and Discussion:** Under marketing channels and actors, please use a diagram to show the channels; it looks nicer and is easy to understand with graphical representations.
- **Recommendations:** Should be based on statistically significant variables.
