This article explains in a friendly way some of the implications that an intensive acceleration in the use and refinement of AI may pose. The article is in my opinion very clear and suitable to explain the problem to a general audience. From a scientific point of view does not add new ideas or consideration to existing literature. Some of the so called fears are actually already a fact and in this sense the authors, in my opinion, may write a new article exploring real cases of job loss due to AI. This is unfortunately a reality. The initial statement, where authors associate technological advancement to societal advancement could have been better elaborated. Is it true that technology now is helping humans? Or as the authors hint, is it mostly helping a select capital? The idea of human life "liberated" from working activities is it really desirable? What people do in the new free time? In a society where work is not necessary, the sense of sacred is lost, values disappear, what is left, other than consumption? And this consumption whom does benefit?
