You have a lot of comments from reviewers. Overall, this was a good case study based on symptomology. Minor changes that I would suggest are as follows:

1. In Abstract, in the conclusion, add the word symptoms after COVID
2. In the text, you state "natural supplements may provide a therapeutic benefit for the treatment of COVID." again I would add symptoms after it as that is all you are assessing.
3. You state, Vitamin D is essential treatment. This is needs to be toned down as, not everyone will feel that it is essential. It is possible that it may help some people with their symptoms from COVID from the literature, but it has not been confirmed.
4. All your statements about each of the supplements do need to be careful with the language as you are only reporting on one case, and literature.
