Potential competing interests: No potential competing interests to declare.

In your manuscript, I have the following concerns:

1. The abstract of the article is written more generically. It must address the introduction, problem statement, and then connect the proposed technique with the problem statement.
2. What is the motivation for using the proposed model?
3. There are some strange sentences in the paper. The authors should revise the use of English and secure the quality of the presentation.
4. The introduction is 'verbose,' meaning that it performs a kind of literature review, failing at the end to depict the open research questions and how these are managed by the current work. In my opinion, such a discussion could be incorporated into a separate section, being extended to holistically cover the research subject.
5. Make all figures symmetric. They all are in different sizes (i.e., width), so try to make figures of the same width to improve the visual impact of the article.
6. I am not satisfied with the references either. Please use the latest and relevant references, which are not older than 2-3 years.
