

Review of: "“Correlation does not Imply Causation”, while Psychotropic Drugs do cause Neurochemical Imbalances and Dysfunction of Neurotransmission"

Laura Abenante

Potential competing interests: No potential competing interests to declare.

I have found this text very fluent and interesting to read. What is currently scientifically known about the human brain is only a small part of the whole. And, certainly, what is behind the onset of mental illness is still a field to be explored. Noteworthy, it remains important to recognize the great strides made so far, which have led to the clarification of many pathological bases and thus allowed cures and treatments. Through a topic of such extreme scientific importance, I have felt a lack of referenced data on the concepts explained. Finally, I think the authors could describe suggestions for the resolution of the hypothetical problem on the use of psychotropic drugs.
