

Review of: "The symptomatic expression of infection with the Omicron variant in Chinese patients; findings from the Clifical COVID-19 clinical case registry"

Gurdeep Singh

Potential competing interests: The author(s) declared that no potential competing interests exist.

The data were prospectively collected data which adds strength to the study methods.

One study's drawback is that serology was not done to confirm the COVID variant.

The paper is well-written and reader-friendly

Tables and figures are helpful, especially figure 4, which compares the data with UK and France data

Why were the symptoms divided into clinical and homeopathic? Even though it was discussed in the paper, the author should provide more details.

The symptoms were similar between the UK, France, and China, so the study does not add anything new to already known knowledge.

There can be many factors for fever-related symptoms being more pronounced in the Chinese population, but the author should add a possible explanation in the discussion section.
