This newer version of the article looks good. The abstract is well written and gives the summary effectively. The introduction to the topic provides a good literature review. The methodology gives details about the study conducted, explaining the inclusion and exclusion criteria. It also gives an overview of the international base of the study and limitations encountered during the study. The results now have statistical analysis and details and appreciate the researcher's effort. Figures and tables are well constructed and illustrative. The statistical analysis, including Cronbach's α , McDonald's ω , and the range of the corrected item total correlations, looks good. The limitations of the study were addressed in detail. The conclusion is in accordance with the topic. The version now looks good to me. Thanks
