Potential competing interests: No potential competing interests to declare.

1. The study of livelihood vulnerability is important, especially in the Mekong Delta (MRD) in Vietnam.
2. The title of the research article needs to be concise and precise.
3. The presentation of the problem is good, but the methodology lacks clarity.
4. Has a well-structured questionnaire been used for the study? If so, the data collected from the survey needs to be analyzed, and results need to be presented more systematically.
5. Apart from the seasonal calendar of activities undertaken by the communes and the extreme weather phenomena studied here, a very vague presentation of the level of the vulnerability of livelihood has been addressed. The author/authors could have attempted to construct livelihood vulnerability indices to analyse the vulnerability of households in the area.
6. The impact of unnatural factors on livelihood in the communes could have been studied by fitting regression models and by classifying the unnatural factors into social and economic factors.
7. Classification of the factors would improve the study of the impact of the factors contributing to vulnerability.
8. The model can either be represented pictorially or can be developed quantitatively by using multiple regression models.
9. Each model can be presented separately, and the pros and cons and the solution of each can be discussed.
