dear editor in chief I read this manuscript carefully in my opinion, this manuscript is suitable for publish. This method and technique are combined of ADM and DTM for solving systems of ODEs.

But some points are suggested for better transparency of this article:

in page 8: last line, x_{11} , x_{12} How was it defined? where did this determination come from?

in page 9, example 1: it is better all calculation and simplification be done, especially calculation of r . (this is must do once, just for example 1)

format of all references is not the same.

all references must be in same shape and format.

after this revise this paper can be published

Best Regards
