**Potential competing interests:** No potential competing interests to declare.

The article compares climate change and sustainability approaches in Sweden and India. The topic is interesting but I think it lacks many requirements for publication as a scientific article. Firstly, introduction section should be improved. A good theoretical international background is needed to support the main research argument. The introduction should clearly delimit the scope of the main subject, provide an international overview background on the covered research topic and quickly move to setting the argument/context and the goal of the research. Furthermore, the research argument must state the need and value added for this research. Secondly, concerning the methodology, it would be better to explain what is new. I can't find anything new. In general, the paper seems just an application of a well-known methodology. Thirdly, the conclusions are very general and must be detailed. Finally, the references cited in the bibliography are not used throughout the article.
