**Potential competing interests:** No potential competing interests to declare.

The article is a study that emphasizes how Turkey's policies towards agriculture and food security will grow in order to solve the complex problems created by climate change in the agricultural sector. For this purpose, it is envisaged to update the policies that serve agriculture and food security, to increase food costs and security due to climate change, and to encourage sustainable agricultural methods.

According to the detailed explanations, it is a study that contributes to the scientific community and indirectly to the country's economy by discussing in detail the current situation of the agricultural sector in Turkey, its legal structure and its status in development plans.

However, although it is a comprehensive and highly detailed study on both climate change and the agricultural sector, various revisions are required to further improve the quality and impact of the paper. Each of the relevant issues is listed below:

- The main structure of the article is not clear. Moreover, it is not clear what the main purpose of the article is and what it tries to conclude, what exactly the method is. In this context, especially general headings (Introduction, Method, Findings and Discussion and Conclusions) need to be improved more clearly.
- Although the article appears to be a reviewed study, it is more of a compilation study.
- Some headings contain too much detailed and repetitive information. There are no connections between paragraphs in the article. This makes it difficult to fully understand the subject. In this context, the summary should be shorter but the information should be enriched with more literature.
- At the same time, although the necessary environmental policies and development plans are mentioned in detail, no discussion is included. In this respect, discussions should be made with the literature.
- The data used in the article is not up to date. Most of the data in the tables and figures cover the processes until 2020, while a very small part covers the data for 2023. In this context, data in tables and figures should be updated.

Best regards...
