Potential competing interests: No potential competing interests to declare.

The topic of this article is relevant and so interesting concerning energy storage systems. The authors give us a brief resume of the history, characteristics and features, manufacturing process, and potential uses. Nevertheless, from my point of view, this article has to be more detailed in how the physical realization of nanogate capacitors can be possible; also, it would be recommendable to complete it with a review of experimental setups and the real reported use of these devices.
