INSERM. (1999). Orphanet: an online rare disease and orphan drug data base.

Hyperplastic polyposis syndrome. ORPHA:157798

Hyperplastic polyposis syndrome is a rare, genetic intestinal disease characterized by the presence of multiple (usually large) hyperplastic/serrated colorectal polyps, usually with a pancolonic distribution. Histology reveals hyperplastic polyps, sessile serrated adenomas (most common), traditional serrated adenomas or mixed polyps. It is associated with an increased personal and familial (first-degree relatives) risk of colorectal cancer.
