Dear Editor;

Bosco and his colleagues prepared an impressive study here. They isolated some important compounds. The main issue in this study is that the isolated compounds were not characterized using various spectroscopic methods. The structures of the new compounds in the manuscript should be thoroughly characterized using various spectroscopic techniques (NMR, FTIR, UV-Vis, MS, etc.). The findings should be discussed in the Results and Discussions section. Additionally, all spectra should be added to the supporting information section. Only after these additions will the work reach a publishable level.

Kind regards,
