# Review of: "Dermatoglyphics: The Future of Screening Type 2 Diabetes Mellitus?"

Asaad Babker<sup>1</sup>

1. Gulf Medical University, United Arab Emirates

## Suggestion for Improvement:

- Other genetic, environmental, and lifestyle factors that might influence fingerprint patterns and diabetes risk are not adequately controlled or discussed. Include a broader range of demographic information and health histories in the analysis to adjust for potential confounders.
- Expand on the implications of findings for clinical practice or public health. Discuss how dermatoglyphics could be integrated into existing screening programs for diabetes.

## Declarations

**Potential competing interests:** No potential competing interests to declare.
