

Review of: "Targeting the Warburg Effect with Glucosodiene: A Case Report of a 43-year-old Female after Mastectomy of the right breast and axillary clearance with Successful First Case Treatment for Metastatic Triple Negative Breast Cancer (TNBC) of Bone"

Roxana V. Alasino

Potential competing interests: No potential competing interests to declare.

Although the so-called "Warburg Effect" was described almost a century ago, and there are a large number of reports that relate differential glucose consumption to the development of tumors, this has not been a common objective in the development of therapies.

The application of therapies based on this principle is a widely justified approach, which could contribute to the effectiveness of conventional treatment, without adding significant toxic effects.

I believe this report makes an important contribution to the research and development of antitumor therapies.
