Potential competing interests: No potential competing interests to declare.

The subject of the work is quite nice.

My suggestions:

It should be stated whether the research is retrospective or prospective.

Exclusion criteria in the study and how the sample selection of 428 people was decided upon can be stated.

Did all researchers fill out the survey questions completely?

The scale would have been preferred in measuring perceptions and attitudes regarding the COVID-19 vaccine. The questionnaire prepared by the researchers can be given as an appendix.

Limitations of the study may be added.

Results of similar studies related to the subject in Turkey can also be included.
