Potential competing interests: No potential competing interests to declare.

Introduction can be summarized more in relation to the description of the most general biological aspects and should focus on food, which was the focus of the article. Furthermore, talk about the importance of investigating the dietary aspects of the body to highlight the relevance of such investigation.

Can a collection during the rainy season influence any dietary factors?

Suggestion: Go back to the introduction and emphasize the seasonal factor in food; this will generate a better connection.

Tables 1 and 2 can be better represented without the shading in the background of the first rows and columns. Only use lines.

In the discussion, there is no need to explain or repeat the results, just the discussion.

Discussion: Relate better.

Sentence: This difference in the percentage of foods may be due to seasonal and environmental changes and the unsuitability of these foods in the current study area.

Go deeper with references that better explain the effect of seasonality and the environment.

Sentence 2: Variation in percentages may be due to the size of the fish, differences in species and seasons, and items available in the study environment.

Explain better, with more references such as the size, species, and seasons that influence it.
