Potential competing interests: No potential competing interests to declare.

This revised version of the paper has been substantially improved. The information is well integrated into the existing literature. It is abundantly obvious that the emphasis is placed on the intricate cognitive processes involved in constructing the expressions being investigated. Furthermore, for the purpose of resolving the problem of bias towards one factor rather than the other, the concept of "full-fledged cultural-cognitive linguistics" is called for with great enthusiasm.

Overall, the approach that is proposed is a very appropriate starting point for analysing oxymora, considering all the possible cognitive mechanisms underpinning them and from a variety of perspectives, e.g., deliberate metaphor.
