Potential competing interests: No potential competing interests to declare.

The paper is well-written with a clear research problem. The author(s) argue for a modified Shapely Value to be used to ensure equitable distribution of benefits in a servitization-based alliance. While I am not an expert in the mathematical portion of the paper, the arguments of the paper are solidly established. The author(s) can consider how would they validate their findings given that the same needs to be tested in the real environment. I recommend publication of the paper
