Potential competing interests: No potential competing interests to declare.

1. The flowers are composed of a green outer shell called a **coconut mo** – **what is coconut mo?? Is this correct?**
2. Each flower can produce more than 0.6 liters of honey every 12 hours – it is not coconut honey. It is neera. To make honey from it, the neera need to be concentrated.
3. In the fig. 2. What you are showing is coconut toddy and not neera. For neera collection, collecting vessel should be in ice box. Otherwise the neera will ferment immediately and produce alcoholic product (toddy). So there are various designs available for these ice boxes kindly add them.
4. Explain clearly the difference between neera, nectar, coconut honey and toddy (they all different).
