The paper titled 'Analyzing the Science of Apple Juice: Insights Into Production, Preservation, and Health Effects' is interesting and provides some insightful points. However, there are some major points that the authors should revise. Here are some of my recommendations:

Authors should avoid writing in a romantic manner; the information should be presented scientifically and objectively.

The subject of this article is apple juice; however, the authors present nutrition and health effects data about apples, not about the juice. This is a significant distinction.

In the third section, authors should include a flowchart outlining all the processing steps.

In the current apple juice industry, there are many innovations during the process that should be referenced.

In the 'Methods of Preservation' section, the authors referred to 'hot water bath canning.' Did the authors mean pasteurization?
