**Subject: Giardia lamblia Infection and Associated Risk Factors Among Patients Who Are Seeking Stool Examination at Bule Hora University Teaching Hospital, West Guji Zone, Ethiopia**

After reading and reviewing this manuscript, I found the following:

Giardiasis is a very important disease that infects humans (more in children) and animals, especially in developing countries. I think the number of samples analyzed is quite limited.

Although microscopic examination is not able to detect the giardia cyst stage, it is still the first method to use, especially in developing countries. I guess molecular methods such as PCR are more sensitive to detect the parasite.

The results are interesting and provide insights about giardiasis and its relationship with different risk factors.

In my opinion, it is very important to do more studies on giardiasis, not only to identify the risk factors but also to detect and identify the different Giardia genotypes for well controlling the transmission routes and for applying good treatment.
