Dear Authors,

This study is really good. I have a few queries and observations:

1. Operational Definitions for Primary, Secondary and Tertiary regarding education should be mentioned?
2. How was the sample size reached? Needs to be explained?
3. 40-49 years may not be considered old?
4. Conclusion needs to be taken with a pinch of salt as the data is based on the patients coming to a regional hospital.  
Patients coming to a regional hospital will be invariably having complications.
