Fuchs heterochromic iridocyclitis

INSERM

Source

INSERM. (1999). *Orphanet: an online rare disease and orphan drug data base*. [Fuchs heterochromic iridocyclitis](#). ORPHA:263479

Fuchs heterochromic iridocyclitis (FHI) is an ocular disease of unknown etiology occurring in a very small percentage (0.5-6.2%) of uveitis cases, characterized by diffuse iris heterochromia or atrophy, keratic precipitates in the absence of synechiae, and in some cases evolving to glaucoma and vitreous opacities.
