

## Review of: "Nanomaterials: History, Production, Properties, Applications, and Toxicities"

Randa Abdel-Karim

Potential competing interests: No potential competing interests to declare.

Strength Points:

Nanotechnology is one of the top subjects for investigation.

## Weakness Points:

- 1. There are thousands of review articles summarizing the concepts and applications of nanotechnology. The authors should show the novelty of the work.
- 2. The authors should study the application of nanomaterials in-depth; preparation techniques, obtained results, and trends should be illustrated.
- 3. Tables, schematics, and illustrations should be added.
- 4. The abstract reflects that the article mainly focuses on sustainability and environmental issues, especially metal oxides, but going through the article, other materials and other applications are briefly discussed.
- 5. References formatting should be rechecked.
