

Review of: "Enhancing Soil Stabilization in Soft Soils Through The Addition of Sand to Soil-Cement Piles: a Comprehensive Study"

Vishwas Nandkishor Khatri

Potential competing interests: No potential competing interests to declare.

Though the scope of research is interesting, the same can't be said about the manuscript. Some highlighting points for improvement are:

- Title is confusing as it is simply soil stabilization, not soil-cement piles.
- The introduction has not cited very few literature sources to establish the research gap and novelty of work.
- The methodology of sample preparation is not clearly mentioned.
- The chemical reaction of saline water/soil + additive needs to be clearly brought out to understand the mechanism.
- The tables lack clarity as it is unable to make out the columns corresponding to with additive and without additive, and so on. Graphical presentation to show the variation will be appropriate.
- The write-up and presentation lacks clarity.
