Title: Enhancing Cocoa Crop Resilience in Ghana: The Application of Convolutional Neural Networks for Early Detection of Disease and Pest Infestations

This topic is interesting and seems to be practical. However, there are some concerns to be resolved carefully at this stage. Please find my comments in the following:

- The literature review section is not well done. It is better to list the most relevant studies in a table and compare them with the present study.
- What are the innovations of this research?
- The results of the research, for example, the accuracy of the model, are not stated.
- The research results should be expressed in the form of graphs or tables.
- Compare the results of the presented model with other methods.
