Human Myeloid Progenitor Cells CLT-008

National Cancer Institute

Source

National Cancer Institute. *Human Myeloid Progenitor Cells CLT-008*. NCI Thesaurus. Code C82381.

Early-to late-stage myeloid progenitor cells derived from adult human stem cells with potential hematopoietic activity. Upon infusion, human myeloid progenitor cells CLT-008 proliferate into mature myeloid cells, including granulocytes, macrophages, platelets, and erythrocytes. These myeloid progenitor cells die within forty-five days after a burst of hematopoiesis. This agent cannot create lymphoid cells, including T cells associated with graft-versus-host disease (GVHD).
