Potential competing interests: No potential competing interests to declare.

In general, the manuscript has successfully incorporated the fundamental principles of One Health. The author should include contemporary approaches in Indonesia, such as how to utilise Wolbachia-infected mosquitoes for biological control, the implementation of environmentally friendly and species-specific chemicals, and potentially other relevant methods like insecticide-treated paints for households rather than conventional practices only. It is important for the author to revise the repetitive sentences within the manuscript. Additionally, the author should provide how One Health utilizes epidemiological data to develop various programs, including the prediction of disease outbreaks and vector control. Furthermore, the manuscript should address the involvement of policymakers in this context. The author should use GIS-based data to make or highlight infected areas in Indonesia as well as surroundings.
