

Review of: "The Role of Ferroptosis in Inflammatory Bowel Disease: Mechanisms and Therapeutic Implications"

Tanggang Deng

Potential competing interests: No potential competing interests to declare.

The review of Qiu Yan describes ferroptosis and its distinctive mechanisms in the context of Inflammatory Bowel Disease (IBD). The importance of this topic is not in question. IBD is a chronic disease with an increasing incidence worldwide. The structure of the paper is complete and clear. There are still some issues that need to be improved.

1. The author should offer models for ferroptosis and its distinctive mechanisms in the context of IBD.
2. Many references are missing, such as page 3, line 7-8, line 21-23; page 7, line 25-26.
3. Part 4, "The Role of Iron in IBD," should be placed before Part 3, "The Mechanism of Ferroptosis in IBD on IECs."
4. I think it would be more interesting if the author summarizes inhibitors or drugs for IBD via regulating ferroptosis.
