

Review of: "Does Exchange Rate and Interest Rate Affect Stock Prices in Nigeria?"

Arzu Alvan Bozdereli

Potential competing interests: No potential competing interests to declare.

This study appears to have used appropriate data and methodologies. A major expected result is that the interest rates will be effective and negative, especially in the short term. In the long term, it is more likely there will be a link between risk share and interest rates, however, it is normal there will be no link. The author should conclude his study with recommendations for policymakers. An example would be the development of a more transparent financial market, the stabilization of the economy, providing information about the risks and benefits of investing in the stock market to investors, and increasing financial literacy among investors.

On the other hand, taking into account the versions of the manuscript in Qeios as well as the author's own work, the similarity report (Turnitin) indicates a similarity of 42%. This is an extremely high similarity rate in terms of academic publishing ethics.
