

Review of: "Reducing non-revenue water in Egypt using GIS"

Asenath Ayieko

Potential competing interests: No potential competing interests to declare.

This is quite good, though the author lacks consistency in most of the sections. There is much repetition of the methodology framework in the text, which should be avoided.

The information provided to the reader on how UFW is a problem is scanty. The author should also try to illustrate historical methods used in the reduction of UFW before discussing how GIS will be beneficial in this research.

The author needs to demonstrate clearly and stepwise to the reader how GIS will reduce UFW.

The study area maps need to be improved and lack key directional features; the author needs to rework them.

Clearly state your findings and fully discuss them. The output in this study is more general; how has the UFW been reducing after adoption of the strategies?

The conclusion is not directional but rather a repetition of what is in the abstract. Avoid rewriting the objectives but conclude based on your study results.
