Mini review highlights important agendas of public health threat, which is the smoked form of tobacco. The impact of smoking on oral health is deleterious, as it is not only a risk factor for oral cancer, but the prognosis of different dental treatment procedures, e.g., dental implants, bone grafting, flap surgery, etc., becomes poor. Similarly, drafting the tobacco control policy by authorities is slowly taking pace, but implementation of the law is still challenging. Hence, the best option is awareness and mass education regarding the effects of tobacco products on oral health and general health.
