

# Review of: "Future Trends in Ground Improvement: A Review"

R. Madhav Madhira

**Potential competing interests:** No potential competing interests to declare.

The paper is an excellent survey of all the recent developments in allied fields such as AI, Robotics, Sustainability, IoT, etc. The language is very good. The major drawback of the paper is that no examples, figures, case histories, etc., are presented. The reader is left with a vague feeling of what exactly is proposed to be implemented. For example, the carbon footprint of various activities can be given. Figures to illustrate the applications of the different approaches would be a great benefit to the profession.

A small point: Section 3.2, the second paragraph, is repeated in the text.

I recommend that the article be accepted with the proviso that it is modified as suggested.
